

IBM Assignment-2

Name: Guruarchana V(Team Leader)

Batch No:B7-1A3E

Build a Python, Assume you get temperature and humidity values (generated with a random function to a variable) and write a condition to continuously detect the alarm in case of high temperature.

Code:

```
import random

for i in range(0,10):

    temp=random.randint(0,100)

    humid=random.randint(0,100)

    print("temperature level:"+str(temp))

    print("humidity level:"+str(humid))

    if(temp==range(27,38) and humid==range(30,50)):

        print("NORMAL TEMPERATURE")

    elif(temp<27 or humid>50):

        print("COOL TEMPERATURE")

    elif(temp>38 or humid<30):

        print("ALERT -VERY HIGH TEMPERATURE")
```

The screenshot shows an online Python compiler interface. On the left, there's a sidebar with icons for file management and a 'Run' button. The main area is split into two panes: 'main.py' on the left and 'Shell' on the right. The 'main.py' pane contains the Python code from the previous block. The 'Shell' pane shows the output of the code, which is a series of lines representing the random temperature and humidity values and the corresponding status messages. The output is as follows:

```
temperature level:47
humidity level:36
ALERT -VERY HIGH TEMPERATURE
temperature level:32
humidity level:86
COOL TEMPERATURE
temperature level:64
humidity level:62
COOL TEMPERATURE
temperature level:81
humidity level:17
ALERT -VERY HIGH TEMPERATURE
temperature level:14
humidity level:18
COOL TEMPERATURE
temperature level:89
humidity level:75
COOL TEMPERATURE
temperature level:42
humidity level:72
```
